

“Food Finder App UX/UI Redesign”

Submitted By: Amna Fatima

Submitted To: NFS Internship

Tool Used: Figma

Project Overview:

The purpose of this project was to redesign a food ordering application by improving its user experience and interface. The original design was functional but lacked a modern layout, clear navigation, and visual consistency. The redesigned version focuses on creating a cleaner interface, improving usability, and making the application more user-friendly.

User Flow

Login → Home → Search → Order Confirmation

Final improved Design link:

Current UX Problems:

Login Screen:

The login screen had a very basic appearance and did not create a strong first impression. The logo did not clearly represent a food delivery application, and the input fields looked plain without icons or visual guidance. The overall spacing and layout could also be improved to make the interface feel more balanced.

Home Screen:

The home screen displayed food items as simple text, making it difficult for users to quickly understand the available products. The search bar was too basic, category buttons lacked emphasis, and the overall layout contained unnecessary empty space. The screen did not provide enough visual hierarchy.

Search Screen:

The search interface was not clear enough for users. The "Tap Here" label was confusing, product information was difficult to scan, and search results were not displayed in a visually organized way. The overall design lacked consistency.

Confirmation Screen:

The confirmation page only showed limited information after placing an order. Important details such as the delivery address and complete order summary were missing, making the confirmation less informative for users.

(Insert screenshots of the original screens here.)

Low-Fidelity Wireframes:

Before designing the final interface, low-fidelity wireframes were created to organize the layout and user flow. These wireframes helped define the placement of important elements such as navigation, search, product listings, and confirmation details before moving to the final design.

The following wireframes were created:

- Login Screen
- Home Screen
- Search Screen
- Confirmation Screen

(Insert wireframe screenshots here.)

High-Fidelity Design:

After completing the wireframes, the final interface was designed in Figma. The updated design includes a cleaner layout, better typography, improved spacing, product cards, consistent buttons, and a more modern appearance. Every screen follows the same design style to provide a consistent user experience.

The final design includes:

- Login Screen
- Home Screen
- Search Screen
- Confirmation Screen

(Insert final UI screenshots here.)

Responsive Design:

The application was designed to work across different screen sizes using Figma Auto Layout.

The following layouts were prepared:

- Mobile (390 × 844)
- Tablet (768 × 1024)
- Desktop (1440 × 1024)

The interface adjusts according to the screen size while maintaining consistent spacing, alignment, and usability.

(Insert responsive screenshots here.)

Accessibility:

Basic accessibility principles were considered during the redesign. A readable font size was used throughout the interface, colors provide sufficient contrast for better visibility, buttons are large enough for easy interaction, and the layout follows a clear visual hierarchy. Consistent spacing and simple navigation also help improve usability for different users.

Design Process:

The redesign started by reviewing the existing interface and identifying usability issues. After analyzing the problems, low-fidelity wireframes were prepared to plan the layout. These wireframes were then converted into high-fidelity screens using Figma. Interactive prototypes were created to demonstrate the user flow, and responsive layouts were prepared for different devices. Finally, accessibility improvements were applied to make the interface easier to use.

Case Study:

Problem:

The original Food Finder application had a simple interface with several usability issues. Product information was not presented effectively, navigation was basic, and important order details were missing from the confirmation screen. These issues affected the overall user experience.

Process:

The redesign process began with analyzing the existing interface and identifying areas for improvement. Low-fidelity wireframes were created to reorganize the layout, followed by

high-fidelity screens in Figma. Product cards, improved navigation, consistent buttons, and better spacing were added to create a cleaner and more user-friendly interface. Responsive layouts and accessibility improvements were also included.

Solution:

The redesigned application provides a modern and consistent user interface. Product cards make food items easier to browse, the search experience is more organized, and the confirmation page now displays complete order information. Navigation has also been simplified to help users complete tasks more efficiently.

Impact:

The redesign improves usability, readability, and visual consistency throughout the application. Users can now search for food more easily, view product information clearly, and understand their order details without confusion. The responsive design also ensures a better experience across different devices.

Accessibility Considerations:

Accessibility was considered while designing the interface to make it comfortable and easy for users to navigate. A readable font size was used throughout the design, and clear color contrast between the background, text, and buttons improves visibility. Buttons and clickable elements are large enough to interact with easily on different screen sizes. The layout remains clean and consistent across desktop, tablet, and mobile versions, helping users understand the interface without confusion. Simple labels and organized spacing were also used to create a smooth and user-friendly experience.

- (1) Font size is 14px or larger.
- (2) Green and white colors provide sufficient contrast.
- (3) Buttons are large enough for easy interaction.
- (4) Consistent spacing is maintained across all screens.
- (5) Navigation labels are clear and readable.
- (6) The interface follows a consistent layout across devices.

Conclusion:

This project demonstrates the complete redesign of a food ordering application using Figma. By improving the interface, navigation, responsiveness, and accessibility, the application now provides a cleaner and more user-friendly experience. The redesign follows basic UX principles and creates a more modern and practical solution for everyday users.
